Software Development Lifecycle Used:

The software development lifecycle used in this project is Iterative Waterfall Model.

The iterative waterfall model provides feedback paths from every phase to its preceding phases, which is the main difference from the classical waterfall model.

This is because this model is one of the most widely used for projects of this size. It also has feedback, using which the software can be developed in a more correct way. Not only this, it also has the required simplicity that one demands in a beginner level project, where one has started out.

It does have certain drawbacks, but most of them are related to actual industry based applications, however they have little to no effect in a project like one assigned, here being the development of a website with the required specifications over a period of time.
